Artwork/Project Description

A solo web development studio I founded in October 2024 to learn how software actually reaches people, not just how it compiles. It has grown into a working pipeline of demo sites, client projects, and delivered company websites.

- PROBLEM**Small Indonesian businesses could not picture what they were buying. A proposal describing "a responsive company website" means nothing to someone who has never commissioned one. Conversations died at that gap.
- APPROACH**Stop describing, start showing. I built a library of 31 industry demo websites, one per niche, so a salon owner receives a working salon website instead of a paragraph and a restaurant owner receives a restaurant one. The pitch became something they could click through rather than imagine.
- IMPACT**Two client projects delivered and paid, four company websites shipped, over fifty tracked prospects. The impact on me was larger: my closing problem was a communication problem wearing a technical costume.
- LEARNED**Build the thing that removes the other person's uncertainty, not the thing that showcases your skill. Those are rarely the same thing. Fifty leads and two closed clients teaches you something only if you refuse to round it up.

Rielcode Business Platform — Laravel
Operations System

Year Accomplished

2025 – 2026

Role/Position

Full-Stack Developer
Self-initiated · Individual project

Publication Link

rielcode.com

Artwork/Project Description

A Laravel and Filament platform that runs my studio's operations: orders, invoicing in two currencies, audit logging, and admin settlement. Live at rielcode.com, with payment gateway integration still ahead.

PROBLEM	For a year I ran the business out of spreadsheets and chat history. Invoices in one folder, scope in WhatsApp, payment status in my memory. When I forgot which client had paid a deposit, I understood the business had outgrown my notes.
APPROACH	Laravel with Filament for admin, MySQL underneath. Orders, invoice generation in IDR and USD for local and international clients, and a settlement view. The hard call was audit logging: free editing was faster to build, but a record that can be silently changed is not a record.
IMPACT	Client state lives in one queryable place instead of across four apps. The payment gateway is the next milestone and is not yet built, which I state plainly because a portfolio of only finished things is not an honest picture of how software gets made.
LEARNED	Modeling a real domain is harder than implementing features. I rewrote the order and package relationship three times before it stopped fighting me. Constraints I impose early, like immutable audit trails, are the ones I thank myself for later.

available on request

Artwork/Project Description

A personal AI assistant system of 45 modular skills, built to externalize the decision of what to work on next. It sits between software engineering, knowledge management, and self-observation.

PROBLEM	I am a full-time student running a business alone. My scarcest resource is not skill, it is deciding what to do next. I would open my laptop with six hours free and spend forty minutes deciding how to spend them.
APPROACH	45 modular skills on Claude Code. Some I imported and studied; the ones I wrote target my own friction: client proposals from a pricing source of truth, lead tracking, deployment checklists, coursework support. The design problem was memory, since an assistant that forgets your rules each session is a search engine with better manners.
IMPACT	Work that took an evening takes an hour, and work I avoided because starting was expensive now gets started. The unmeasured outcome matters more: the system remembers the standard I set on a good day and holds me to it on a tired one.
LEARNED	Designing a tool that shapes your own behavior is a different discipline from designing one for a stranger. I had to be honest about my actual weaknesses rather than my imagined ones.

Rendering Advertisements With Code

Year Accomplished

2026

Role/Position

Developer and Creative Director
Self-initiated · Individual project

Sample renders available on request

Artwork/Project Description

A pipeline that renders video advertisements from code instead of editing them by hand, built with Remotion and Manim. It produced 93 finished video assets across four aspect ratios.

PROBLEM	I needed ads in four aspect ratios, in several message variants, refreshed constantly because advertising creative decays. Editing those by hand would have consumed every hour I had. Editing them twice would have consumed hours I did not have.
APPROACH	Remotion renders video from React components; Manim handles animated explanatory sequences. Scene timing, typography, and brand color tokens live in one shared theme file, so changing the palette re-renders the whole library. My creative constraint was a three second maximum per scene, drawn from studying which ads held attention.
IMPACT	93 finished video assets across formats and campaigns, including the referral program. What used to be a bottleneck became a build step.
LEARNED	Version control, refactoring, and shared design tokens are not concepts video production usually borrows from software, and they should be. I also found that concurrent renders collide silently while reporting success, which taught me to distrust any signal I have not verified myself.

Artwork/Project Description

A company website rebuild for the Canadian entity of an international education network, with an admin-managed news system and an AI chatbot. Delivered and paid in May 2026.

PROBLEM	They had a website, but it was a rough basic build that did not represent an organization of their size. Behind one complaint were two problems: the visible one was presentation, the real one was dependency, since every content change required a developer, so the site went stale and stayed stale.
APPROACH	I rebuilt the site with a proper visual identity and responsive layout, then solved the dependency directly. An admin-managed news system lets their team publish without touching code. An AI chatbot trained on company information answers visitor questions at any hour instead of queuing them in an inbox.
IMPACT	The client moved from a placeholder presence to a website their team owns and operates. The news section is updated by staff, not by me, which was the actual goal. Delivered on schedule and closed in May 2026.
LEARNED	Clients describe symptoms, not causes. This one asked for a nicer website and needed independence from their developer. The most valuable feature I shipped was the one that made me unnecessary.
