

FTI Marketplace

HCI FINAL PROJECT · PRESENTATION

From a WhatsApp group to a real marketplace.

A cross-platform campus marketplace for the Faculty of Information
Technology, designed from student research and shipped as a working app, web
storefront, and admin.

Interaksi Manusia & Komputer

FACULTY

FTI · UKSW

01 THE PROBLEM

The marketplace already exists — in a chat that fights you.

WHAT BREAKS TODAY

- **Discovery is impossible.** Listings vanish up the chat as new messages arrive. No search, no category, no archive.
- **Trust is a guess.** No reviews, no track record, no verified identity to tell a reliable seller from a stranger.
- **No structure.** Price, condition, location buried in free-text paragraphs you cannot filter.
- **Negotiation is awkward.** Haggling happens in public group chat where everyone watches.

THE CONVENTIONS TO KEEP

The group already uses intent tags. The app maps them to a **listing_type** so every post carries its purpose:

#WTS Want to Sell

#WTB Want to Buy

#WTT Trade-in

#WTBT Barter

DESIGN GOAL

Keep the social habit students already have. Replace only the parts that fail: search, structure, and trust.

02 USER RESEARCH

We asked FTI students before we built anything.

A 10-question Google Forms survey to FTI students. Small but pointed sample — the signal was strong and consistent enough to steer every design decision that followed.

8

survey respondents,
FTI students 18-23

6/8

name discovery as
their biggest pain

7/8

trust a seller by
photo + identity

0

wanted **web-only**
— dual platform confirmed

02 WHAT THE DATA TOLD US

Findings that became features.

BIGGEST PAIN IN INFORMAL TRADING (Q4)

WHAT EARNS TRUST IN A SELLER (Q7)

DESIGN IMPLICATIONS

- **Discovery is the headline.** Search + browse + category filter lead the product — not a nice-to-have.
- **Trust = identity, not just email.** Avatar + real name lead the seller row; verified-email is secondary.
- **Required, card-visible fields.** Condition + negotiable-price were near-unanimous mandatory listing info.
- **COD-first.** Pickup on campus is the primary deal model; money never flows through the app.
- **Gamify with status.** Open feedback asked for a leaderboard + reward — badge tiers became the reward.

PLAN-CORRECTING INSIGHT

We had framed campus-email as the headline trust signal. The data moved it to secondary and elevated profile photo + identity.

02 THE PERSONA

Who we are designing for.

**Aufa, 19**

FTI student · interested but hasn't transacted yet

GOALS

- Find a used laptop or electronics from someone on campus, fast.
- Know the seller is real and trustworthy before meeting.
- Buy and sell without leaving a noisy group chat.

FRUSTRATIONS

- "Sulit menemukan penjual/pembeli" — can't find who is selling what.
- Scared of being scammed by a stranger with no track record.
- Listings scroll away; no way to search back for them.

BEHAVIOUR

Need-based user, not a daily browser. Trusts via profile photo + identity. Wants to read others' reviews first. Mobile-first, electronics-led.

The marketplace, built mobile-first.

03 TRUST, RETENTION & GAMIFICATION

Features that close the survey's loops.

TRUST
Ratings + badges

RE-ENGAGE
Wishlist + notifications

GAMIFY
Leaderboard

One codebase, every screen size.

SAME FLUTTER CODE, RESPONSIVE WEB

- **The same app, compiled to web.** No second frontend — `flutter build web` is the alternative storefront.
- **Adapts, not stretches.** Card grid scales 2 → 6 columns; bottom tabs become a side rail on desktop.
- **Verified at 360 / 768 / 1280 / 1920px** before demo.
- **Admin lives here too.** A Filament dashboard at `/admin` is the assignment's "Desktop Application" — full CRUD over every table.

ARCHITECTURE

One Laravel API + one MySQL DB. App, web, and admin all read and write the same source of truth — no second database, no sync.

04 DESIGN RATIONALE & CONSISTENCY

One brand language across three surfaces.

WHY THESE CHOICES

- **Colour.** Royal blue + navy read as trustworthy and academic; yellow is the single accent for CTAs and highlights.
- **Layout.** Soft rounded cards, pill buttons, bottom-tab nav — the secondhand-marketplace pattern users already know.
- **Type.** Fraunces for display warmth, Outfit for clean UI text, JetBrains Mono for labels and data.
- **Shared terms.** Listing / Seller / Offer / Transaction mean the same thing in app, web, and admin.

PALETTE — SINGLE SOURCE OF TRUTH

CROSS-PLATFORM CONSISTENCY (GRADED)

The four brand hex values and shared component vocabulary are defined once and reused everywhere — so the Flutter app, the web build, and the Filament admin feel like one product.

The prototype is a running product, not a mock.

MOBILE

Flutter app

Public marketplace: browse, search, sell, chat, offer, review. Token auth — stays logged in across restarts.

WEB

Same code → browser

Identical storefront, responsive across breakpoints. The alternative marketplace.

ADMIN

Laravel + Filament

Desktop dashboard. Full CRUD, moderation queue, stats — the "Desktop Application".

06 USABILITY TESTING RESULTS

We tested with real FTI students, then fixed what broke.

3 FTI participants given real tasks on the working build — register, search a listing, make an offer, create a listing, update profile. Observed, not helped.

TASK OBSERVED	WHAT WE SAW	OUTCOME / FIX
Search a listing	All 3 found the item fast; search + category chips read instantly.	Success
Make an offer	2 hesitated — "offer" vs "chat" buttons looked equal weight.	Fixed — made Offer the primary CTA
Create a listing	Completed, but one missed that a photo was required until validation fired.	Fixed — surfaced required-field hint earlier
Register / login	Smooth; stayed logged in after closing the app, as intended.	Success
Update profile	All 3 found settings and the theme toggle without help.	Success

LOOP CLOSED

Issues found → fixed in the app → re-verified. The testing fed straight back into the product, not just the report.

A noisy group chat, turned into a product students helped design.

Research-led · Cross-platform · Working build · Tested with real users
